"Riley's Run Too" D. Lehrschall 1May2020

Time and distance estimates are derived or extrapolated from tables I created using Car and Driver vehicle performance test data for my vehicle and GPS g-force data.

## Math-based Process:

1) Develop a preliminary path strategy
2) Breakdown that course path into individual elements
3) Estimate each turn or curve radius measure
4) (My) Suggested estimates of driven slalom radii are 100 ft for 3 cones at $45-\mathrm{ft}$ intervals and 125 ft for 3 cones at 60 ft
5) Note each element's speed limits based upon vehicle's turn (g-force) capability. - Ref: SCCA Solo Rules Section 2.2
6) Estimate the length of straight sections joining these curved elements.
7) Record each straight's beginning speed based upon the limiting speed of the linked, preceding element. Record the ending speed based upon the limiting speed of the linked, following element.
8) Determine* the "optimum" straight elements' and longer curve speed strategies:
a) Increasing
b) Increasing then decreasing
c) Increasing, held constant (?), then decreasing
d) Decreasing
*Each element's range is defined by it's connecting elements.
9) Adjust path strategy and repeat

Example A:
Given:
a) A vehicle with a 1.15 g cornering capability, $0-60 \mathrm{mph}$ in 3.8 seconds, and $70-0$ in 156 feet
b) Seg 4 a 90 -degree, 80 -foot radius / Seg 5 a 300 foot straight / Seg 6 a 90 -degree, 40 -foot radius

|  |  |  |  |  |  |  |  | 26 mph |

## Walking the course:

1) Develop a preliminary path strategy (Green path minimizes sharp turns)
2) Breakdown that course path into individual elements (Note number segments)
3) Estimate each turn or curve radius
4) (My) Suggested estimates of driven slalom radii are 100 ft for 3 cones at 45 - ft intervals and 125 ft for 3 cones at 60 ft - Estimate your speed capability for each 5) Note each element's speed limits based upon vehicle's turn (g-force) capability. - Ref: SCCA Solo Rules Section 2.2 turn and slalom
5) Estimate the length of straight sections joining these curved elements.
6) Record each straight's beginning speed based upon the limiting speed of the linked, preceding element. Record the ending speed based upon the limiting speed of the linked, following element.
7) Determine* the "optimum" straight elements' and longer curve speed strategies:
a) Increasing
b) Increasing then decreasing
c) Increasing, held constant (?), then decreasing
d) Decreasing

Estimate your speed capability for each considering your turn or slalom exit speed, the next segment entry speed, and the straight segment's length related to acceleration and braking distances.
*Each element's range is defined by it's connecting elements.
9) Adjust path strategy and repeat
